# Introduction

# Energy Consumption Pattern of KReSIT

**Figure 1 :** Energy Consumption of KReSIT in 1st week of September 2015

## Focus Areas to Reduce Energy Consumption

### Split-up of Energy Consumption

| <b>Average Energy Consumption</b><br>(in kWhr per day) | <b>Weekdays</b> | <b>Weekends</b> |
|--|-----------------|-----------------|
| Total  | 3307.814        | 2741.568        |
| AC Load  | 1618.618        | 1346.384        |
| Non-AC Load  | 1689.235        | 1395.184        |
| <b>AC Load %age</b>                                    | <b>48.9%</b>    | <b>49.1%</b>    |

# Air Conditioning Systems in KReSIT

## Overview

- We have over 150 Air Conditioning Systems in KReSIT
- All these systems are different from each other with respect to their working technology

### Types of Air Conditioning Systems in KReSIT

- Window AC in Faculty Cabins
- Split ACs in Office, Library, and Server Rooms
- One Chilled Beam System in Circular Hall
- Two Variable Refrigerant Flow (VRF) Air Conditioning System in Classrooms and Laboratories (2nd & 3rd floor)
- One Ductable Air Conditioning System in F.C. Kohli Auditorium

## WHY Focus on Ductable AC of F.C. Kohli Auditorium?

### Because...

- Users always feel freezing cold in there
- It doesn't have any centralized system to maintain the thermal comfort level
- Power wastage and User comfort, both are intolerable

### Thus...

It is a genuine concern to understand the behaviour of these air conditioning systems, so that we can reduce its energy consumption maintaining user comfort

# Understanding Air Conditioning System of F.C. Kohli Auditorium

Figure 2 : Schematic of Air Conditioning System in F.C. Kohli Auditorium

## Components of Air Conditioning System of FC Kohli Auditorium

- Two Ducted Beams
- Two Air Mixing Plenum Units
- Six Air Conditioning Units

## Ducted Beam

- Ducts are used in HVAC system to deliver and remove air
- Duct system is planned (laying out) and optimized with detailed study on finding the pressure losses through it
- Located at the ceiling of the auditorium, on both the halves of the auditorium
- These beams pass the chilled air into the auditorium

## Air Mixing Plenum Units

- It is used for mixing air from different ductwork systems
- It has a variable air volume valve which are driven from 0% to 100% opening for balancing the air flow
- It collects chilled air from all air conditioning units and passes it to ducted beam

## Air Conditioning Units

- These are 7.5 TR air conditioners manufactured by Voltas
- Their condensing unit uses non-inverter technology based compressor units similar to split-ACs
- They use R22 refrigerant to cool the air in the evaporator
- Their evaporator unit has a fan motor rating of 1.5HP
- They have a air volume control lever attached to it

## Air Conditioning Units

- Each air conditioning unit has an individual control panel
- Set point of each air conditioning unit is 23°C
- Studies[2] show that 23°C is the most suitable set point for Air Conditioning systems
- User is comfortable within temperature band of 22°C - 24°C

# Current Operation of Auditorium's Air Conditioners

If FC Kohli auditorium is booked for an event of 2 hours, then this is what the HVAC Operator does currently:

- Turn ON four air conditioning units when the event is going to start according to the schedule
- Keep them ON, until the event ends
- We followed this strategy and recorded the power and temperature profile of the auditorium to understand the losses

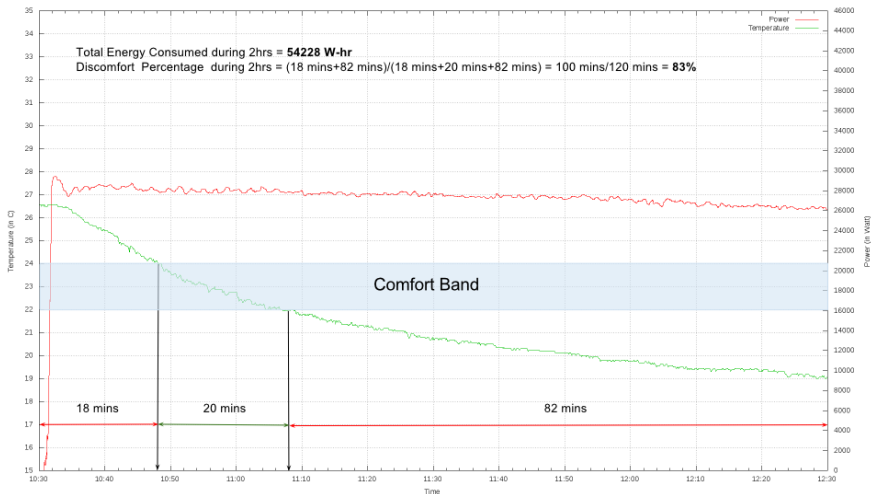

Figure 3 : Current Operation of Auditorium's Air Conditioning System

## Observations

- For **initial 18 minutes** user was **uncomfortable** as  $T_r > T^U$
- For **last 82 minutes** user was **uncomfortable** as  $T_r < T^L$
- User was **comfortable** hardly only for **20 minutes** as  $T^L < T_r < T^U$
- Total energy consumption was around **54228 Watt-Hrs.**
- For about **83%** of total event duration users were uncomfortable due to either no cooling or extra cooling.
- Compressor unit didn't turn OFF automatically although the temperature inside the auditorium was far below the set point.

## Inferences

- **Pre-cooling** can be applied to get rid of initial discomfort experienced by user
- A thermal comfort **band maintenance** can be done to keep user comfortable throughout
- **Peak shaving** can be done by checking feasibility for minimum number of air conditioning units

# Understanding Power Consumption in Non-Inverter Technology

Figure 4 : Power Consumption of individual air conditioning unit

| <b>AC ID<br/>Turned ON</b> | <b>Energy Consumed<br/>for 10 minutes<br/>(in Watt-Hr)</b> | <b>Scaled Energy Consumption<br/>to 1 hour<br/>(in Watt-Hr)</b> |
|----------------------------|--|---|
| 1                          | 1158   | 6948  |
| 2                          | 906  | 5436  |
| 3                          | 1242   | 7452  |
| 4                          | 1442   | 8652  |
| 5                          | 1064   | 6384  |
| 6                          | 1004   | 6024  |

**Table 1 :** Power Consumption of individual air conditioning unit

Figure 5 : Cumulative Power Consumption of Air Conditioning Units

| <b>Number of ACs Turned ON</b> | <b>Energy Consumed for 10 minutes (in Watt-Hr)</b> | <b>Scaled Energy Consumption to 1 hour (in Watt-Hr)</b> |
|--------------------------------|--|---|
| 1                              | 1160   | 6960  |
| 2                              | 2345   | 14070   |
| 3                              | 3606   | 21635   |
| 4                              | 4694   | 28164   |
| 5                              | 5839   | 35036   |
| 6                              | 6680   | 40080   |

**Table 2 :** Cumulative Power Consumption of air conditioning units

## Observations

- Every air conditioning unit consumed about constant power of 6000-8000 Watts throughout
- Power consumption of different number of air conditioning units differs from about 7000 Watts which is big

## Inference

- Constant power gap between different number of air conditioning units can be used to determine how many air conditioning units can be turned ON

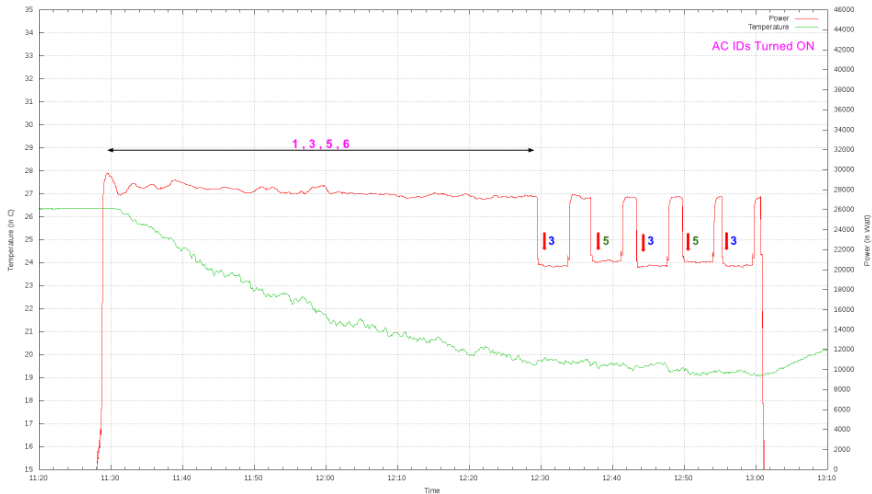

Figure 6 : Automatic Turning ON/OFF of Compressor Unit

## Observations

- The temperature of the auditorium was  $19.5^{\circ}\text{C}$  when the set point of  $23^{\circ}\text{C}$  was reached for air conditioning unit
- There is a huge gap of around  $4^{\circ}\text{C}$  between the temperature of the auditorium and the one sensed by the thermostat of the air conditioning unit

## Inference

- Feature of automatic turning OFF of the compressor doesn't fulfil its target of maintaining the thermal comfort level and also wastes energy due to extra cooling.

# Estimating Maximum Number of Air Conditioning Units under Peak Power Limit

## Recalling these observations...

- **Inferred from Figure 5:** Cumulative power consumption of these air conditioning units, show a huge difference of around 7000 watts per air conditioning unit
- **Inferred from Figure 4:** Power consumption of a single air conditioning unit might vary from 8000 watts to 6000 watts at an instant

### Equation derived to estimate maximum number of AC

Given Peak Power Limit of  $P$  watts, maximum number of air conditioning units  $m$  that can be turned ON is given by

$$m = \max\left(\frac{P + 1000}{7000}, \frac{P - 1000}{7000}\right) \quad (1)$$

# Modeling the Cooling of Auditorium

## Details of Experiment

- In this experiment, we cooled down the auditorium to its maximum with different number of air conditioning units
- The time duration of the experiments was 3 hours
- Graphs on next slide show the cooling patterns with different number of air conditioning units

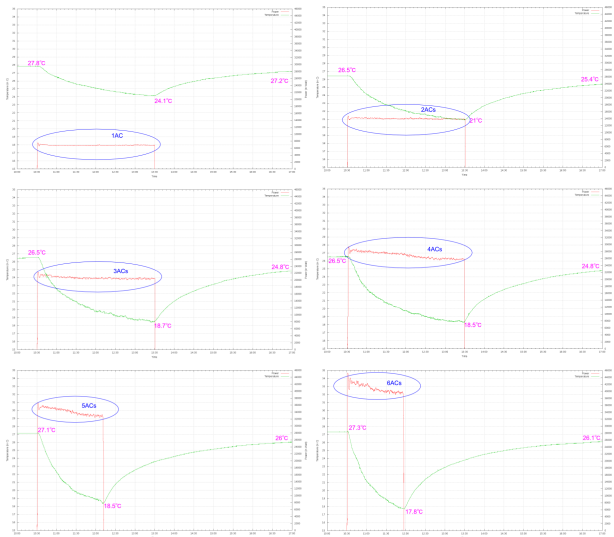

Figure 7 : Cooling by different number of ACs

| <b>Number of ACs Turned ON</b> | <b>Energy Consumed (in Watt-Hr)</b> | <b>Time Duration (in hrs)</b> | <b>Drop in Temperature (in °C)</b> |
|--------------------------------|-------------------------------------|-------------------------------|------------------------------------|
| 1                              | 20408                               | 3                             | $27.8 - 24.1 = \mathbf{3.7}$       |
| 2                              | 41950                               | 3                             | $26.4 - 21.0 = \mathbf{5.3}$       |
| 3                              | 61764                               | 3                             | $26.4 - 18.8 = \mathbf{7.6}$       |
| 4                              | 79832                               | 3                             | $26.5 - 18.5 = \mathbf{8.0}$       |
| 5                              | 57428                               | 1.75                          | $27.1 - 18.5 = \mathbf{8.6}$       |
| 6                              | 58740                               | 1.5                           | $27.3 - 17.8 = \mathbf{9.5}$       |

**Table 3 :** Energy Consumption of Different number of ACs while cooling

## Exponential Behaviour of Temperature Change

- Previous studies[1] shows that the change in temperature follows the exponential pattern when the room/auditorium is cooled down or warmed up for a given ambient temperature.
- The exponential pattern of cooling/warming can be given as:

$$T_i(t) = ae^{-bt+c} + d \quad (2)$$

where  $T_i$  is the temperature value of the auditorium at a given time instant  $t$

## Exponential Behaviour of Temperature Change

- **Figure 7** clearly shows that cooling pattern is different with different number of air conditioning units turned ON
- Hence, the coefficients  $a, b, c, d$  for Equation 2 will be different for different number of air conditioning units turned ON
- Thus, on fitting the curve upon our experimental data, we get the following values of the coefficients

| <b>Number of ACs<br/>Turned ON</b> | <b>a</b> | <b>b</b> | <b>c</b> | <b>d</b> |
|------------------------------------|----------|----------|----------|----------|
| 1                                  | 14.75    | 0.00022  | -1.279   | 23.78    |
| 2                                  | 1.018    | 0.00022  | 1.757    | 20.65    |
| 3                                  | 0.739    | 0.00024  | 2.283    | 19.19    |
| 4                                  | 0.742    | 0.00034  | 2.372    | 18.27    |
| 5                                  | 1.053    | 0.00052  | 2.122    | 18.55    |
| 6                                  | 7.506    | 0.00050  | 0.264    | 17.02    |

Table 4 : Cooling coefficients of equation for Different number of ACs

# Deriving Equation to Estimate Cooling Time

## Equations

- Solving equation 2, we get

$$t = \frac{1}{b} \left( c - \ln \frac{T_i - d}{a} \right) \quad (3)$$

- Therefore, the time required for  $T_i$  to reach from  $T^U$  to  $T^L$  can be given as

$$C_i = \frac{1}{b} \left[ \left( c - \ln \frac{T^U - d}{a} \right) - \left( c - \ln \frac{T^L - d}{a} \right) \right] \quad (4)$$

$$C_i = \frac{1}{b} \ln \frac{T^L - d}{T^U - d} \quad (5)$$

| <b>Number<br/>of ACs<br/>Turned ON</b> | <b>26°C-24°C</b><br>(in mins) | <b>24°C-22°C</b><br>(in mins) | <b>22°C-20°C</b><br>(in mins) | <b>20°C-18°C</b><br>(in mins) |
|--|-------------------------------|-------------------------------|-------------------------------|-------------------------------|
| 1                                      | 176                           | -                             | -                             | -                             |
| 2                                      | 34                            | 67                            | -                             | -                             |
| 3                                      | 24                            | 37                            | 86                            | -                             |
| 4                                      | 14                            | 20                            | 37                            | -                             |
| 5                                      | 10                            | 14                            | 27                            | -                             |
| 6                                      | 8                             | 11                            | 17                            | 37                            |

**Table 5 :** Cool down time for different bands for different number of ACs

# Algorithm for Feasibility Analysis

---

**Algorithm 1** Feasibility Analysis

---

**Given :** Thermal Comfort Band  $[T^U, T^L]$ , Peak Power Limit  $P$ , Time Duration  $T$

- 1: Determine maximum number of air conditioning units  $m$  using Equation 1.
  - 2: **For all**  $AC_i$  for  $i = 1$  to  $m$
  - 3:     Determine cooling time  $C_i$ , using Equation 5.
  - 4:     **If**  $C_i$  does not exist then
  - 5:         *Infeasible*
  - 6:     **Else if**  $C_i$  exists and  $C_i > T$  then
  - 7:         *Infeasible*
  - 8:     **Else if**  $C_i$  exists and  $C_i < T$  then
  - 9:         *Feasible*
  - 10:    **Endif**
  - 11: **Endfor**
-

# Conclusion

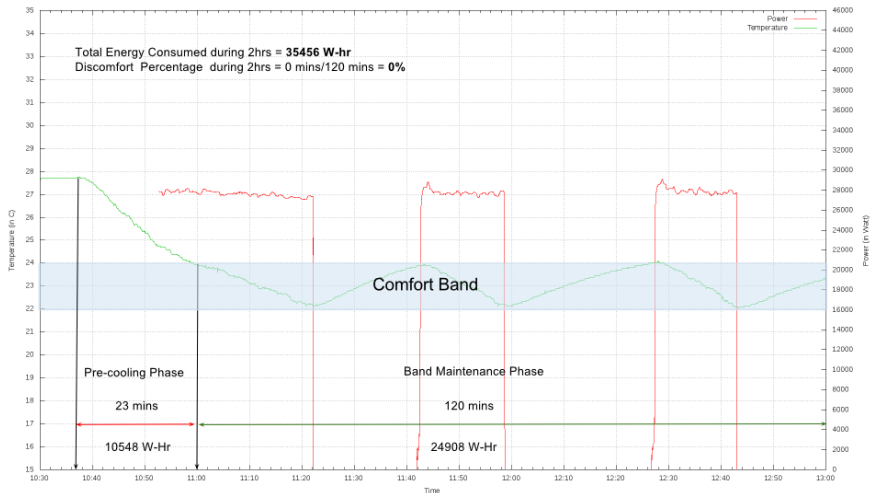

Figure 8 : Optimized Operation of Auditorium's Air Conditioning System

| Comparison           | Energy Consumed<br>(in Watt-Hr) | Discomfort Level<br>(in %age) |
|----------------------|---------------------------------|-------------------------------|
| Current Scheduling   | 54228                           | 83                            |
| Optimized Scheduling | 35456                           | 0                             |
| Total Savings        | 18772                           | -                             |

**Table 6 :** Results about Energy saving and Comfort Level

## Results

Following our approach over the current one can save around **36.4%** of energy achieving **0%** discomfort in the auditorium.
